

Need an automated solution for importing patient documents directly into Allscripts TouchWorks® EHR?

Try eFiler, the ultimate electronic patient chart utility.

EHR Integration Services designed its eFiler solution to allow users of the Allscripts TouchWorks EHR to import a patient's electronic document directly into the chart to eliminate waiting for the scanning department to print, scan and index patient files.

Eliminate Scanning and Streamline Office Workflow

The front desk staff simply inserts a patients' thumb drive into the nearest computer to import any necessary documents into that patient's chart before they see the physician. These documents are then immediately available for use within that chart.

The eFiler solution may also be used in an exam room when a patient provides the physician with an electronic copy of notes from an office visit with an out-of-state provider. In this case, the physician simply clicks on the eFiler tab in the Allscripts TouchWorks EHR and imports the document right into the patient's chart.

The simple but powerful eFiler productivity solution provides the following benefits:

- Increased productivity through reduced scanning department backlogs and wait times
- Reduced clinical errors through direct import of data into the patient chart
- Improved patient care by providing the physician with immediate visibility to a patient's clinical and administrative documents
- Great return on investment through full integration with the functionality of Allscripts TouchWorks EHR
